The Nobel Assembly at Karolinska Institutet

6 October 2025

The Nobel Assembly at Karolinska Institutet has decided to award the 2025 Nobel Prize in Physiology or Medicine to:

**Mary E. Brunkow**

Institute for Systems Biology,  
Seattle, USA

**Fred Ramsdell**

Sonoma Biotherapeutics,  
San Francisco, USA

**Shimon Sakaguchi**

Osaka University,  
Osaka, Japan

*“for their discoveries concerning peripheral immune tolerance”*

## They discovered how the immune system is kept in check

---

The body's powerful immune system must be regulated, or it may attack our own organs. Mary E. Brunkow, Fred Ramsdell and Shimon Sakaguchi are awarded the Nobel Prize in Physiology or Medicine 2025 for their groundbreaking discoveries concerning *peripheral immune tolerance* that prevents the immune system from harming the body.

---

Every day, our immune system protects us from thousands of different microbes trying to invade our bodies. These all have different appearances, and many have developed similarities with human cells as a form of camouflage. So how does the immune system determine what it should attack and what it should defend?

Mary Brunkow, Fred Ramsdell and Shimon Sakaguchi are awarded the Nobel Prize in Physiology or Medicine 2025 for their fundamental discoveries relating to peripheral immune tolerance. The laureates identified the immune system's security guards, *regulatory T cells*, which prevent immune cells from attacking our own body.

"Their discoveries have been decisive for our understanding of how the immune system functions and why we do not all develop serious autoimmune diseases," says Olle Kämpe, chair of the Nobel Committee.

Shimon Sakaguchi was swimming against the tide in 1995, when he made the first key discovery. At the time, many researchers were convinced that immune tolerance only developed due to potentially harmful immune cells being eliminated in the thymus, through a process called *central tolerance*. Sakaguchi showed that the immune system is more complex and discovered a previously unknown class of immune cells, which protect the body from autoimmune diseases.

Mary Brunkow and Fred Ramsdell made the other key discovery in 2001, when they presented the explanation for why a specific mouse strain was particularly vulnerable to autoimmune diseases. They had discovered that the mice have a mutation in a gene that they named *Foxp3*. They also showed that mutations in the human equivalent of this gene cause a serious autoimmune disease, IPEX.

Two years after this, Shimon Sakaguchi was able to link these discoveries. He proved that the *Foxp3* gene governs the development of the cells he identified in 1995. These cells, now known as regulatory T cells, monitor other immune cells and ensure that our immune system tolerates our own tissues.

The laureates' discoveries launched the field of peripheral tolerance, spurring the development of medical treatments for cancer and autoimmune diseases. This may also lead to more successful transplantations. Several of these treatments are now undergoing clinical trials.

Scientific background to the Nobel Prize in Physiology or Medicine 2025 (pdf)

---

**Mary E. Brunkow**, born 1961. Ph.D. from Princeton University, Princeton, USA. Senior Program Manager at the Institute for Systems Biology, Seattle, USA.

**Fred Ramsdell**, born 1960. Ph.D. 1987 from the University of California, Los Angeles, USA. Scientific Advisor, Sonoma Biotherapeutics, San Francisco, USA.

**Shimon Sakaguchi**, born 1951. M.D. 1976 and Ph.D. 1983 from Kyoto University, Japan. Distinguished Professor at the Immunology Frontier Research Center, Osaka University, Japan.

---

**Prize amount:** 11 million Swedish kronor, to be shared equally between the laureates.

**Press contact:** Pernilla Witte, +46 8 524 86 107, [pernilla.witte@nobelprizemedicine.org](mailto:pernilla.witte@nobelprizemedicine.org) or Thomas Perlmann, [thomas.perlmann@nobelprizemedicine.org](mailto:thomas.perlmann@nobelprizemedicine.org), Secretary-General, The Nobel Assembly at Karolinska Institutet.

## THE NOBEL PRIZE

---

### Nobel Prizes 2025

Six prizes were awarded for achievements that have conferred the greatest benefit to humankind. The 14 laureates' work and discoveries range from quantum tunnelling to promoting democratic rights.

See them all presented here.
